

Style 410 Braided PTFE Tape

Characteristics

Braided of pure PTFE providing a soft, resilient, fully chemical-resistant gasket seal.

Operating Conditions

Suitable for a pH range of 1-14. When used in low pressure applications (less than 20 psig) 410 may be used up to 260° C, but as pressure is increased, temperature limit must be reduced. This is because of the elasticity of PTFE as the temperature rises.

Examples: at 150 psig a temperature of 38 ° C is suggested.

at 80 psig a temperature of 110 ° C is suggested

Maximum values-temperature and pH should not be combined on any one application without careful consultation. Common sense balancing of factors is always wise.

As with any product designed to operate in critical operations, this product and its installation must be clearly understood. In addition, the user should have full knowledge of the operating considerations of the equipment in which it is to be installed.
