

KLINGER®top-chem 2006 - PTFE filled with barium sulfate, this pigment-free gasket material with excellent resistance to strong alkalis.

Produced from PTFE filled with barium sulfate, this pigment-free gasket material convinces with its excellent resistance to strong alkalis as well as with good mechanical properties at medium to low temperatures and loads. This gasket material is primarily used in the chemical industry.

Basis composition PTFE filled with barium sulfate.

Color White

Certificates BAM-tested, DIN-DVGW, DNV GL approval, TA-Luft (Clean air), FDA conformity (components of KLINGER®topchem 2006 comply with the FDA requirements)

Sheet size 1500 x 1500 mm

Thickness 1.0 mm, 1.5 mm, 2.0 mm, 3.0 mm

Tolerances

Thickness according to DIN 28091-1

Length: ± 50 mm

Width: ± 50 mm

P-T diagram - thickness 2.0 mm

The area of the P-T diagram

- ① In area one, the gasket material is normally suitable subject to chemical compatibility.
 - ② In area two, the gasket material may be suitable but a technical evaluation is recommended.
 - ③ In area three, do not install the gasket without a technical evaluation.
- Always refer to the chemical resistance of the gasket to the media.

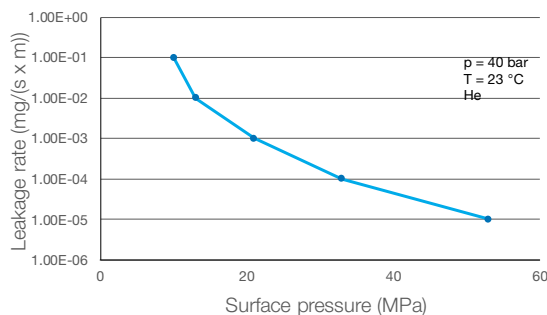

Sigma BO

Maximum surface pressure in operating conditions of Sigma BO

This diagram shows the maximum surface pressure in MPa with which the sealing material may be loaded, depending on the operating temperature. The characteristic curves apply to the specified sealing thicknesses. In contrast to Q_{smax} according to EN 13555, the surface pressures specified here are based on a maximum permissible reduction in thickness.

Tightness performance

The tightness performance graph

The graph shows the required stress at assembling to seal a certain tightness class. The determination of the graph is based on EN13555 test procedure which applies 40bar Helium at room temperature. The sloping curve indicates the ability of the gasket to increase tightness with raising gasket stress.

Chemical resistance chart

Simplified overview of the chemical resistance depending on the most important groups of raw materials:

KLINGER®top-chem 2006

						A: small or no attack	B: weak till moderate attack	C: strong attack			
Paraffinic hydrocarbon	Motor fuel	Aromates	Chlorinated hydrocarbon fluids	Motor oil	Mineral lubricants	Alcohol	Ketone	Ester	Water	Acid (diluted)	Base (diluted)
A	A	A	A	A	A	A	A	A	A	A	A

All information is based on years of experience in production and operation of sealing elements. However, in view of the wide variety of possible installation and operating conditions one cannot draw final conclusions in all application cases regarding the behaviour in gasket joint. The data may not, therefore, be used to support any warranty claims. This edition cancels all previous issues. Subject to change without notice.
